12/31	10:00	67	W side of valley		

December 11: A group of 17 bachelor elk process single file across

Elk locations on MPG Ranch during Dec. 2012.

On December 11, a large number of bachelor elk (31 in all) moved south from the Boondocks and Little Baldy into the forested slopes above North Draw.

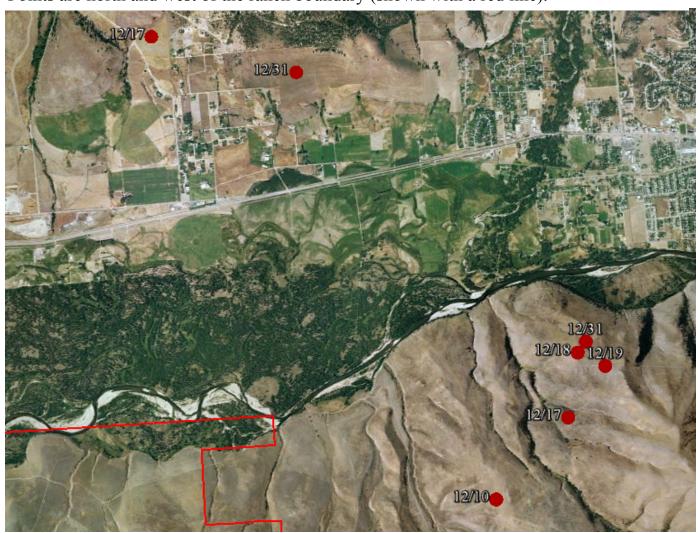

While bachelors cross the saddle, 44 cows and spike bulls rest and graze on a north-facing slope in Baldy Draw.

Three separate bachelor groups cross the exposed hillside, following almost exactly the same path. The first group, 19 bull elk, move in single file and then congregate as they enter a draw. Two smaller groups of 5 and 7 follow within 30 minutes.

As December progressed, elk spent more time off of the ranch. Herds were typically seen to the north on the Sapphire Ranch. Smaller herds also frequented the fields on the west side of the valley, which require elk to cross both the Bitterroot River and Highway 93.

White-tail deer locations on MPG Ranch during Dec. 2012.

Count Location

Time

Date

Whitetail deer observations in December are concentrated in agricultural fields and open landscapes.

This year, I observed an average of 2.3 white-tail deer in a single location during December. In December 2011, the average was 3.7.

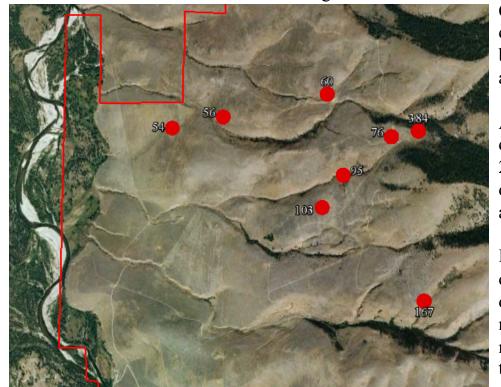

Throughout my December observations, I have seen fewer white-tail deer in conspicuous, open places. Deer tend to flee as soon as humans or vehicles come into view.

Mule deer observations in Dec. 2012. The point column refers to the closest bird point count point.

Date	Time	Count	Location	Point	Notes
12/3	8:58	7	Tongue Creek	167	
12/3	15:26	7	Spurge Hill	54	
12/3	15:31	1	Baldy Draw	56

12/11	9:37	2	N fork Sheep Camp	95	2 - 4x4 bucks
12/11	9:51	2	Foothills sagebrush	60	2 does
12/17	9:31	6	Sheep Camp	103	1 buck, 5 does
12/18	11:43	2	Baldy Draw	384	1 doe, 1 yearling
12/18	11:44	3	Baldy Draw	76	

Mule deer locations on MPG Ranch during Dec. 2012.

Two mule deer does graze on an open bench near point 60.

Observations also show different habits in mule deer between December 2011 and 2012.

Average group size of mule deer was 5.8 in December 2011. December 2012 observations give an average of 4.

In December 2011, I observed 79 mule deer in one day, the greatest number during the winter months last year. So far this year, the highest count was 55 mule deer on November 26, 2012.

Two mule deer does survey from a rocky rise.

Mule deer are most often found in moderately dense bitterbrush communities, and they are well adapted for living in this environment.

When mule deer encounter a mild threat, they often move away slowly, unlike the swift, sudden flight of white-tail deer. However, when alarmed, mule deer may shift to a faster method of escape called *stotting*. This motion uses the full force of all four legs at once to bound up and over rough terrain and shrubs. Each jump can take a deer as high as three feet and as far as 15 feet (Mule Deer Working Group 2003).

Here a mule deer's tracks cover a distance of around eight feet between bounds out of a steep draw.
